

Product Requirements

Warble

Team The Googoo Gagas

Brief problem statement

The motivation for this project is to create a more spatial, visual, and personal way for people to share content online. Instead of posts being buried in a feed, every “warbling” is tied to a real location on a map, turning the homepage into a living world of stories, memories, and updates that users can explore by panning and zooming.

The problem being solved is that traditional posting platforms separate content from context and make creative expression feel limited. This project gives users a way to place posts at meaningful places, design them freely with drag-and-drop elements, stickers, backgrounds, and media, and optionally add interactive scripts, while also supporting accounts, collaboration, moderation, and mobile access so the experience stays usable, social, and safe, and based in context.

System requirements

- Web browser supporting HTML 5
- A mouse and keyboard

Users profile

This system is intended for the people who would like to have a deeper connection and understanding of the place that they live in, as well as those who want to document a living history of the places they have lived and visited. They should be of average reading and writing level in order to understand the content of the system. They should have access to a device with an internet connection.

List of Features

S.N.	Features	Description
1	Interactive map Homepage	An interactive map that acts as the app's homepage, showing where warblings have been posted.
2	Creating a Warble(post)	Creating a memory tied to a location on the map.

3	Post editor	The tool used to build a warbling's page, placing and arranging content like photos, text, and audio.
4	User accounts	Optional accounts so users can keep track of the warblings and comments they've made.
5	Reporting & moderation	A way for users to flag inappropriate or overly revealing posts for review or takedown.

Functional requirements (user stories)

No.	User Story Name	Description	Priority
R1	Map	A map on the homepage which users can pan around and zoom. The map will display 'warblings.' (user posts) If you click on a warbling, it will bring you to another web page with its contents.	1
R2	Post (a 'warbling')	When a user warbles, it must be from a specific location. The user can choose visually on the map, or enter global coordinates. Then, the user is navigated to the editor page. On the editor page, users can upload photos, write text, and format the page layout to their desire. Once uploaded, the warbling will appear on the map, and users who click on it will be navigated to the newly created web page.	1
R3	The editor	This is the tool that will be used to make posts. The editor page allows users to place elements on the screen. An element can be one of these things: An image, an excerpt, an audio clip, a button with an associated script. After making an element, the user can drag and drop it to any location on the screen. Other things that the editor can do: Change the background, place stickers, add borders to elements.	1
R4	User scripting	The ability for users to embed custom scripts in their posts. It should be implemented as a simple API (possibly in Javascript or Lua) that allows automatically moving elements and playing animations. We marked this as a '3' because we are still unsure if this would be a useful feature, and because of potential security concerns.	3
R5	Stickers	Stickers are image elements that don't necessarily have rectangular borders. The editor will contain premade stickers such as "I lived here!" Users should also be able to upload their own stickers in the form of a jpg or png.	2

R6	Borders	A decorative border that may be applied to various elements in the editor. There will be preset options as well as the ability to upload custom borders.	2
R7	Mobile view	Upon making a post, a mobile-friendly view is automatically generated. Though, a user can also make fine adjustments to the mobile view, independently of the desktop view.	3
R8	Consistent user accounts	The ability for users to make a login and password. If a user makes an account, they can view all of their past posts, including comments. However, a user does not have to make an account to interact with most features.	2
R9	Contributions	Users may contribute to someone else's post. The idea is that, if two or more users upload memories of the same location, the posts will be combined. For example, if user A posts a memory of Discovery Park, user B can come and post one at the same location. Then, User B may edit the layout of the post, moving User A's elements to their liking. However, User B may not delete User A's elements and vice versa.	
R10	User timeline	Registered users will have a timeline associated with their account, as long as their account is not private. The timeline includes all of the user's warblings in chronological order, on one continuous web page. The user has the ability to fine-tune this timeline to their liking, independently of the individual warblings in their original contexts.	

Non-Functional Requirements

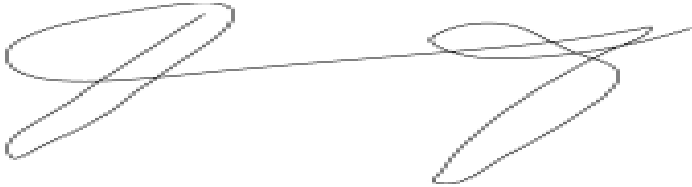

S.N.	Category	Requirement
1	Privacy	Users must be able to create and post warblings without registering an account. Registered user account credentials should be stored using industry-standard hashing (e.g. Bcrypt) and never should be stored or transmitted in plaintext.
2	Privacy(location)	Because posts are tied to real world locations, users must be able to flag a warbling as revealing sensitive information (e.g. a private residence, license plate) and request its takedown or the removal/blurring of the specific revealing detail.
3	Content Moderation	Reported content must be automatically taken off from the site once it reaches a defined report limit and new content should be automatically screened for abusive material prior to publication.
4	Accessibility	The map and editor must be usable by the average user without technical background.

5	combability	The system must function correctly on the latest two major versions of Chrome, Firefox, and Safari,consistent with the HTML5 requirement above.
6	Security	All user-submitted content and uploaded files must be verified and validated server-side to prevent malicious code execution or file uploads.

Sponsor Requirements

I have read and approve the material in this document. If there is no external sponsor, the TA or instructor will sign it for accuracy/scope.
